

Program 3 – Check Whether a String is a Palindrome

Answer / Python Program

```
def is_palindrome(s):  
    s = s.lower()  
    return s == s[::-1]  
  
text = input("Enter a string: ")  
if is_palindrome(text):  
    print("Palindrome")  
else:  
    print("Not a palindrome")
```

Output

```
Enter a string: Madam  
Palindrome
```

Note: The programs were formatted as working Python programs. The triangle program uses the complete area formula $\frac{1}{2} \times \text{base} \times \text{height}$, and the maximum-number program avoids recursive shadowing of Python's built-in `max()`.
