

Program 5 – Count Vowels in a String

Answer / Python Program

```
def count_vowels(s):
    count = 0
    vowels = "aeiouAEIOU"

    for ch in s:
        if ch in vowels:
            count += 1

    return count

text = input("Enter a string: ")
print("Number of vowels =", count_vowels(text))
```

Output

```
Enter a string: Hello World
Number of vowels = 3
```

Note: The programs were formatted as working Python programs. The triangle program uses the complete area formula $\frac{1}{2} \times \text{base} \times \text{height}$, and the maximum-number program avoids recursive shadowing of Python's built-in `max()`.
