

Program 10 – Remove Duplicates from a List

Answer / Python Program

```
def remove_duplicates(lst):
    result = []
    for item in lst:
        if item not in result:
            result.append(item)
    return result

my_list = [1, 2, 2, 3, 4, 4, 5]
print("List after removing duplicates:", remove_duplicates(my_list))
```

Output

```
List after removing duplicates: [1, 2, 3, 4, 5]
```

Note: The programs were formatted as working Python programs. The triangle program uses the complete area formula $\frac{1}{2} \times \text{base} \times \text{height}$, and the maximum-number program avoids recursive shadowing of Python's built-in `max()`.
